SBA Listed

CAGE: 18DR9

ESV Consulting LLC is a Veteran-Owned Small Business delivering cybersecurity advisory and IT diagnostic consulting services to federal agencies, contractors, and commercial organizations. We identify what is broken in your IT operations — before it becomes a crisis. With 15+ years of applied IT operations experience and an active CISSP certification, we translate complex technical findings into clear, actionable decisions leadership can act on.

CYBERSECURITY ADVISORY

Our clients depend on secure, compliant, and resilient systems. ESV Consulting provides structured cybersecurity assessments that identify real risk — not theoretical vulnerability lists. We evaluate security posture, assess controls alignment, and prepare organizations for regulatory and compliance frameworks.

- Cybersecurity Risk Assessment & Gap Analysis
- NIST CSF, CIS Controls & FISMA Alignment Review
- Risk Management Framework (RMF) Readiness
- Incident Response Readiness Assessment
- Security Controls Evaluation & Documentation

IT DIAGNOSTIC CONSULTING

Organizations often know something is wrong but cannot name it precisely. ESV Consulting identifies the root cause — not just the symptom. We assess IT infrastructure, document operational gaps, and deliver findings leadership can act on without a technical background.

- IT Infrastructure Diagnostic Review
- Single Point of Failure Identification
- Process Documentation & Standardization
- Continuity of Operations Planning (COOP)
- Business & Technical Communication Advisory

PAST PERFORMANCE

Critical Infrastructure Recovery | Superstorm Sandy Response

Independently assessed a failed IT environment during an active disaster. Identified thermal shutdown as root cause, executed a prioritized recovery sequence (Active Directory first, VDI infrastructure second), and coordinated cross-site hardware relocation to meet a simultaneous payroll deadline. Provided real-time technical briefing to senior leadership under pressure. Post-recovery: identified a critical undocumented single point of failure — sole power feed dependency — leaving the organization fully exposed. Outcome: core systems restored, payroll deadline met, systemic risk documented for remediation.
